SUBUNIT: Binds TRAF2, TRAF5 and TRAF6. Binds the NH2-termin. domain of CAMLG with its C-terminus (By similarity).
SUBCELLULAR LOCATION: Type III membrane protein (Probable).
SIMILARITY: CONTAINS 2 TNFR-CYS REPEATS.

Gene 227:137-148(1999).

I FUNCTION: THE KERATIN PRODUCTS OF MAMMALIAN EPIDERMAL DERIVATIVE

SUCH AS WOOL AND HAIR CONSIST OF MICROFIBRILS EMBEDDED IN A RIGH

MATRIX OF OTHER PROTEINS. THE MATRIX PROTEINS INCLUDE THE HIGH-

SULFUR AND HIGH-TYMOSINE KERATINS, HAVING MOLECULAR WEIGHTS OF

6-20 kDa, WHEREAS THE MICROFIBRILS CONTAIN THE LARGER, LOW-SULFU

KERATINS (40-56 kDa).

KERATINS (40-56 kDa)

HAIR FOLLICLES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Extracellular.

TISSUE SPECIFICITY: Broadly expressed in: skin, heart, lung, a the reproductive tracts.

DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTE DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTE DOMAIN: DOMAIN IV IS GLOBULAR.

SOMILARITY: CONTAINS 1 LAWININ N-TERMINAL DOMAIN (DOMAIN VI).

SIMILARITY: CONTAINS 1 LAWININ EGF-LIKE DOMAINS.

SIMILARITY: CONTAINS 1 LAWININ DOMAIN IV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       is thought to mediate the attachment, migration, and organizatic of cells into tissues during embryonic development by interacting with other extracellular matrix components.

SUBUNIT: Laminin is a complax glycoprotein, consisting of three different polypeptide chains (alpha, beta, gamma), which are bout o each other by disulfide bonds into a cross-shaped molecule Comprising one long and three short arms with globules at each end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    THE GAMMA-3 CHAIN IS A

THE BETA-2 CHAIN IS A SUBUNIT OF LAMININ-3 (S-LAMININ), LAMININ-4 (S-MEROSIN), AND LAMININ-7 (KS-LAMININ).

-I- SUBCELLULAR LOCATION: Extracellular.

-I- TISSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT). S-LAMININ IS CONCENTRATED IN THE SYNAPTIC COMPONENT). S-LAMININ IS CONCENTRATED IN THE SYNAPTIC CLEFT OF THE NEUROMUSCULAR JUNCTION.

-I- DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COLLED COIL STRUCTURE.

-I- DOMAIN: DOMAINS VI AND IV ARE GLOBULAR.

-I- SIMILARITY: CONTAINS 1 LAMININ N-TERMINAL DOMAIN (DOMAIN VI).

-I- SIMILARITY: CONTAINS 1 LAMININ DOMAIN IV.
Glycoprotein; Basement membrane; Extracellular matrix; C Laminin EGF-like domain; Cell adhesion; Repeat; Signal. SIGNAL 1 32 POTENTIAL. CHAIN 3 1798 LAMININ BETA-2 CHAIN. DOMAIN 33 280 LAMININ N-TERMINAL (DOMAIN DOMAIN 283 346 LAMININ EGF-LIKE 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. C;Comment: This enzyme is the first enzyme of the ubiquitin system directly implicated is
and cell cycle progression, and in cytokine-induced cell proliferation.
